

AirData is a Division of World Fuel Services (Europe) Limited, a subsidiary of World Fuel Services Corporation. For over 20 years, we have been a leading supplier of flight-planning and weather briefing systems to airlines and corporate aviation. We pride ourselves on being very flexible and responsive to our customers' changing needs. Our highly configurable systems are characterised by a detailed knowledge of aviation, combined with a quality approach to the production of software for the mission-critical applications required by the industry.

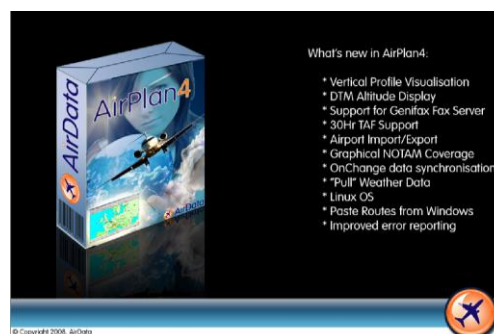

AirPlan4 is the latest version of the AirData system and is available in two forms:

Onsite

The On-site system is designed to integrate seamlessly into larger operations environments, sharing data with other airline systems and automating many processes, creating many opportunities to make savings in time, personnel and money.

Bureau

The "Bureau" service allows customers to access their own server here, at our Gatwick offices, via the Internet (using our AirPlan4 client software, which can be installed on any required workstations). This is designed to be flexible and cost-effective enough for the smaller operator or aircraft owner.

Which of these would best suit a customer depends on operational usage and requirements and we would be happy to discuss the various options and make the appropriate recommendations. Our philosophy is to provide our customers with the most cost-effective solution that they need to be operationally competitive in today's modern aviation environment.

Please call us or email info@airdata.co.uk and we will be happy to discuss your requirements or to arrange a detailed demonstration of our system. This can be performed either by using the web-based briefing system "Intercall", by visiting you in your own offices, or here at our premises near Gatwick. We will be able to answer questions on any system-related topic and provide feedback on the features available, new functions which have been added and integration options into your existing IT environment.

We currently supply over 30 airlines and flight handling companies in Europe, Asia and the USA. Our customer base is wide-ranging, particularly in the regional airlines market. Our systems are in use with a full range of operational types, from small turbo-prop operators all the way through to large regional jet airlines flying hundreds of sectors per day.

Customers include Ryanair, Monarch Airlines, Regional, BMI, Air Contractors, Air Astana and many others. All have the **AirPlan4** system integrated into their operations environment, handling their daily operational needs and future planning requirements. Another important industry customer is Airbus, who use the system for their flight planning and route evaluation within their Commercial, Delivery and Flight Test departments.

We also have many Flight Handling (International Trip Planning) companies using our system, including Gozen Air Services and Simair Services (Istanbul) and Baseops International (Houston).

Our software and support engineers work closely with operations staff and aviation industry professionals to provide a unique mix of skill and knowledge; this is the key to our ability to produce accurate and useable software ideally suited for the operations environment. We make a real effort to create an environment which enables us to be creative and our support team to be helpful and efficient.
